Reactor Charcterization

esults and nalysis

Conclusions

Previous and Present Work

Neutronics [3]

- Control drums give a uniform axial and radial flux profile for all reactivity insertions
- Control drum vs. reactivity curve is sinusoidal

Thermal Hydraulics [4]

Process Control

[3] Peterson, J., 8 2019. An analysis of the nuclear characteristics of a molten salt microreactor. Master's thesis. University of Idaho

[4] Carter, J. P., 2022. Multi-physics investigation of a natural circulation molten salt micro-reactor that utilizes an experimental in-pile device to improve core physics and system thermal-hydraulic performance. Ph.D. thesis, University of Idaho MSNB Modeling & Control

The Molten Salt Nuclear Battery

Process Control Engineering

> Reactor Charcterization

nalysis

Conclusions

Conclusions

Previous and Present Work

Neutronics [3]

Thermal Hydraulics [4]

- Transient simulations can be reduced to 1D and still correspond to STAR-CCM+
- Stable autonomous load following for relatively small ramp function power demand transients

Process Control

onclusions

onclusions

^[3] Peterson, J., 8 2019. An analysis of the nuclear characteristics of a molten salt microreactor. Master's thesis, University of Idaho

^[4] Carter, J. P., 2022. Multi-physics investigation of a natural circulation molten salt micro-reactor that utilizes an experimental in-pile device to improve core physics and system thermal-hydraulic performance. Ph.D. thesis, University of Idaho

Previous and Present Work

Neutronics [3]

Thermal Hydraulics [4]

Process Control

- Design controller *compliment* the autonomous capabilities provided by the passive feedback mechanisms
- Allow larger faster, more aggressive power changes
- Additional focus on time periods with a high degree of time variance (start-up, shut-down, re-start)

The Molten Salt Nuclear Battery

Process Control Engineering

Reactor Characterization

Results and Analysis

Conclusions

D. C.

$$u(t) = \underbrace{K_P e(t)}_{\text{Proportional}} + \underbrace{K_I \int_0^t e(t) dt}_{\text{Integral}} + \underbrace{K_D \frac{de(t)}{dt}}_{\text{Derivative}}$$

Proportional

- Control output is manipulated in proportion to the error defined by the proportional gain constant
- High gain yields an aggressive controller that is prone to overshooting the setpoint
- Low gain may result in steady-state offset

Integral

Derivative

MSNB Modeling & Control

Sam J. Root

The Molten Salt Nuclear Battery

Process Control Engineering

Reactor Characterization

nalysis

onclusions

Conclusions

$$u(t) = \underbrace{K_P e(t)}_{\text{Proportional}} + \underbrace{K_I \int_0^t e(t) dt}_{\text{Integral}} + \underbrace{K_D \frac{d e(t)}{dt}}_{\text{Derivative}}$$

Proportional

Integral

- Considers cumulative error to help eliminate steady-state offset
- As the process variable settles around the set-point, the cumulative error approaches a constant value and the effect of the integral controller diminishes.

Derivative

MSNB Modeling & Control

Sam J. Root

The Molten Salt Nuclear Battery

Process Control Engineering

Reactor Characterization

Results and Inalysis

onclusions

Lonclusions

$$u(t) = \underbrace{K_P e(t)}_{\text{Proportional}} + \underbrace{K_I \int_0^t e(t) dt}_{\text{Integral}} + \underbrace{K_D \frac{de(t)}{dt}}_{\text{Derivative}}$$

Proportional

Integral

Derivative

- Estimates the time rate of change of the error to dampen overshoot
- Backs-off the proportional response when the process variable rapidly approaches the set-point
- Can be difficult to tune

Process Control Engineering

Reactor Charcterization

lesults and nalysis

Conclusions

Deferences

Passive Feedback Temperature Reactivity

Doppler broadening

- Resonance peaks lower and broaden with increased temperature
- High kinetic energy of target nucleus introduces more relative uncertainty of the center-of-mass energy [5, Ch. 7]
- \bullet More epithermal neutrons absorbed by $^{238}U~$ etc. [6, Ch. 6]

Thermal Expansion

MSNB Modeling & Control

Process Control Engineering

Reactor Characterization

esults and nalysis

onclusions

onclusions

^[5] Kerlin, T. W. et al., 2019. Dynamics and Control of Nuclear Reactors. Knoxville, Tennessee: Elsevier Inc

Passive Feedback Temperature Reactivity

Doppler broadening

Thermal Expansion

- Increased temperature leads to lower heavy metal density and smaller macroscopic fission cross-section at high temperature [3]
- Similar to moderator thinning in LWRs

MSNB Modeling & Control

Sam J. Root

Process Control Engineering

Delayed Neutron Precursors

- Most fission events release daughter neutrons promptly
- Sometimes, unstable nuclides which decay by neutron emission are produced instead
- $t_{1/2}$ from less than a second to over a minute [7, Ch. 6]

$$^{87}Br \xrightarrow{\beta^{-}} ^{87}Kr^{*} \rightarrow ^{86}Kr + n$$

Flowing Fuel

MSNB Modeling & Control

Sam J. Root

The Molten Salt Nuclear Battery

Process Control Engineering

> Reactor Charcterization

esults and nalysis

onclusions

Passive Feedback

Flow Reactivity

MSNB

Delayed Neutron Precursors

Flowing Fuel

- Precursors produced near the core exit and long lived precursors may emit their neutrons outside of the core
- These neutrons are effectively lost from the fission chain reaction [5, Ch. 3]
- Larger power transport requires a higher flow rate
- Greater delayed neutron losses
- Negative feedback

Modeling & Control Sam J. Root

Process Control Engineering

Main Operational Control Problem - Transport Delay

Dynamics associated with anticipated transients

- Natural circulation flow mode
- Passive feedback mechanisms
- Transport delays separating heat exchanger and core

Thought Experiment

- Step increase in power demand to a steady-state critical MSNB
- Set-point is instantaneously equal to heat exchanger power consumption
- Ideal controller which produces rapid load following with minimal overshoot
